Python and SQLite, 2 queries executed sequentially instead of concurrently? I have an SQLite database, and I am writing a Python script to manage it. I have a function as follows, and I want to execute 2 queries concurrently: def queryDB(self, query): if self.runQuery(query) == False: #Do something return self.runQuery(query) def runQuery(self, query): try: con = sqlite3.connect(self.file) con.text = query c = con.cursor() c.execute("select * from %s" % self.database) data = c.fetchall() return(data) except Exception, e: print e return None I don't know why, but self.runQuery(query) always returns the same result. In other words, after I query the database by the command con.text = "select * from data" the command never returns data. It seems like it's just executing the query sequentially, but how can I make 82157476af
